In Patterns and Processes of Vertebrate Evolution Carroll undertook an ambitious project — nothing less than to update George Gaylord Simpson's classic works from the 1940s and 50s, Tempo and Mode in Evolution and The Major Features of Evolution. The result is a "broad picture" overview of the processes of evolutionary change, centred on paleontology but attempting to integrate that with the rest of biology.

Patterns and Processes of Vertebrate Evolution is a new text providing an integrated view of the forces that influence the patterns and rates of vertebrate evolution, from those at the level of living populations and species to those that resulted in the origin and radiation of the major vertebrate clades.

Gerardo De Iuliis PhD, Dino Pulerà MScBMC, CMI, in The Dissection of Vertebrates (Second Edition), 2011. Vertebrae. The vertebral column (Figure 9.3) normally includes 14 cervical, 5 thoracic, 6 lumbar, 2 sacral, and 15 caudal vertebrae. The column of the pigeon, as with most birds, is notable for its degree of fusion, with the exception of the cervical vertebrae.

Vertebral Column - an overview | ScienceDirect Topics

The vertebra prominens, or C7, has a distinctive long and prominent spinous process, which is palpable from the skin surface. Sometimes, the seventh cervical vertebra is associated with an abnormal extra rib, known as a cervical rib, which develops from the anterior root of the transverse process. These ribs are usually small, but may occasionally compress blood vessels (such as the subclavian ...

Robert L. Carroll - Wikipedia

The vertebrae C3 through C6 have a more regular shape. They have small bodies, with pedicles that extend backwards and laterally. These vertebrae have large vertebral foramen in the transverse processes, which the vertebral artery, veins, and inferior cervical ganglion pass through. The spinous process of each vertebrae is short, which means that some muscles attach to the nuchal ligament ...
