Quantum Chance Nonlocality Teleportation And

The science fiction version of teleportation is therefore impossible. And yet in 1993 a group of physicists ... began to play around with the idea of nonlocality and invented what we know today as quantum teleportation.... In quantum teleportation, we do not teleport the whole object, only its quantum state... its form.

This amazing 'non-locality' is more than just an abstract curiosity or paradox: it has entirely down-to-earth applications in cryptography, serving for example to protect financial information; it also has enabled the demonstration of 'quantum teleportation', whose infinite possibilities even science-fiction writers can scarcely imagine.

Quantum Chance: Nonlocality, Teleportation and Other Quantum Marvels. Quantum physics, which offers an explanation of the world on the smallest scale, has fundamental implications that pose a serious challenge to ordinary logic. Particularly counterintuitive is the notion of entanglement, which has been explored for the past 30 years and posits an ubiquitous randomness capable of manifesting itself simultaneously in more than one place.

Quantum Chance - Springer

In theoretical physics, quantum nonlocality refers to the phenomenon by which the measurement statistics of a multipartite quantum system do not admit an interpretation in terms of a local realistic theory. Quantum nonlocality has been experimentally verified under different physical assumptions. Any physical theory that aims at superseding or replacing quantum theory should account for such ...

For the nonspecialist reader, I would recommend carefully reading chapter 8, "Quantum Teleportation." In quantum teleportation, we do not teleport the object, we teleport only its quantum state. The next very interesting chapter for a nonspecialist is chapter 10, which deals with current research in nonlocality.

Quantum Chance

Quantum Teleportation Quantum teleportation works by using a well-known property of quantum mechanics known as quantum entanglement. The term denotes the moment in which two or more quantum particles are forced to hold mutually exclusive states. Therefore, knowing one of the particles states simultaneously determines the other particles state.
