Meneghetti et al. examined these small-scale gravitational lenses in observations of 11 galaxy clusters. They found an order of magnitude more small-scale lenses than would be expected from cosmological simulations. The authors conclude that there is an unidentified problem with either prevailing simulation methods or standard cosmology.

Aside from differences in the small-scale details, the overall shapes of the simulated distributions are remarkably consistent with the corresponding observations. Given the strong sensitivity of infrared brightness temperatures to both the horizontal and vertical extent of the cloud field, the similar distributions suggest that the ...
